

You Know These Benefits Of Having Dental Implants!

Dental implants are the first option to replace lost teeth. Regardless of our age, we are all vulnerable to suffer the loss of any of our teeth, this can be caused by accidents or aging. There are several methods to replace these lost teeth and one of the most effective is through [Same Day Dental Implants Houston Tx](#). Next, we tell you 5 benefits of this method. **Upper Dental Implants** is useful when rest of the teeth is ok

Adaptability

A **Full Upper Dental Implants** manages to adapt and fulfill functions that only a natural tooth could perform. In contrast, a removable prosthesis tends to deteriorate both the bone and the nearby teeth, in addition to making basic movements of the mouth impossible, such as eating and smiling.

Multiple Tooth Implants can last a lifetime, provided that the patient has the necessary care and attends periodic check-ups at his Dental Clinic.

- It prevents the deterioration of maxilla bone. Dental implants preserve and stimulate the bone of the jaws by transmitting to them the force of mastication, preventing bone deterioration.
- No risk of decay. The crowns on the implants are not deteriorated by decay since they are made of porcelain on a titanium abutment. The same does not happen when putting the crowns on natural teeth, since it is very probable the formation of caries in the union of the crown with the natural root.
- Optimal results of the treatment with [Same Day Dental Implants](#) in Dental Center have a history of satisfactory and reliable long-term results. It is the most effective method of repair and restoration with a 97% success. Which makes it a very attractive alternative to solve the loss of teeth permanently?

Do not cause damage to other teeth

- When we put an insert, the rest of the fit teeth that are in the mouth stay whole.
- However, when what is placed is a bridge, it does compromise the state of the adjacent pieces, since it is necessary to carve them. This carving involves reducing its size.
- In addition to this, it is important to highlight that the replacement of the lost tooth also prevents unwanted movements in the rest of the teeth in the mouth.
- For this, we start from the basis that the teeth have a natural tendency to move and look for contacts between them

Help preserve the bone

Over time, the loss of a tooth ends up causing desorption of the bone that supported that tooth. This is due to the absence of the root of the tooth and to the fact that the bone does not receive the stimulation characteristic of chewing.

They allow good hygiene

- The hygiene carried out by a person who has all their natural teeth is the same as that practiced by someone with dental implants.
- Being the alternative most similar to our own teeth, the brushing must be the same. The daily routine of hygiene should also include the use of silk and rinsing.
- And, unlike what happens with traditional dentures, the implants are fixed and you do not have to remove them to clean them.
